April 1997

April 10th Demo: Fix a Member's Computer

We will fix a user's Windows 95 problems and create multiple bootable partitions using Partition Magic and System Commander. This will allow Windows95 Windows95-Hungarian version, and DOS 6.22 to be installed, each on their own partition so that they will not interfere with each other. The Windows95 conflicts we expect to solve have to do with a Epson Dot Matrix printer and an Iomega Zip drive located on the same port. In addition, the Zip drive is located using the same assigned letter as a CDROM already present. These are the specific details but we will go through the steps necessary to solve any

hardware conflict within Windows95. If time permits, we will install network cards between a Win95 and Win3.11 computer.

April 23rd Demo: Partition Magic v3.0 and PhotoSuite v8.0

Do you want to change the sizes of your partitions but dread the thought of the backup/fdisk/restore routine? Are you running out of file or swap space on your hard disk? Are you aware that you may be losing up to 40% of your disk space from large clusters? Do you want to upgrade to a new operating system without risking your existing setup? Find out more about how to solve these and other problems by attending our user group meeting at the Simi Valley

Library at 7:30 on Wednesday March 23rd. Our guest presenter will be Dave Whittle, on behalf of PowerQuest Corporation.

Dave will cover the cluster problem and other important hard disk organizing techniques that will make your system perform better and safer. He will also introduce us to the new features of the recently announced Partition Magic V3.0.

PartitionMagic (patents pending) is the winner of numerous awards, including a Fall 1995 Best of Comdex award. Organizing the partitions on your hard drive is so easy anyone can do it in a fraction of the time it used to take. You'll wonder how you got along without it.

The new MGI PhotoSuite 8.0 is a suite of photo software for the internet, home, and office.

It's the complete PC photo companion including over 30 Special Effects, Photo Editing Tools, Photo Lens Kit, Image Capture, Slide Show, Photo Albums, and Internet Helper. Easily input your pictures from scanners and digital cameras.

MGI PhotoSuite has full TWAIN support. No need to buy expensive equipment, create stunning professional results with the Photo Lens Kit, then print to any color printer or post your photos on the Internet. Do it all with photos, from personalized sports cards, magazine covers, greeting cards, and calendars to business ads, flyers and presentations. Bonus Multimedia Library included with hundreds of photos, sound effects, and animation clips.

David B. Whittle has been involved with user groups since 1979, when he first joined an Atari Users Group in San Jose. He has presented to users groups from Washington D.C. to Moscow, Russia. As the founder of one of the world's largest virtual user groups, Team OS/2, and IBM's first OS/2 Evangelist, Dave has also been an active proponent of grass-roots volunteerism. He left IBM in early 1996 to pursue writing and consulting opportunities. He is the co-author, with John C. Dvorak, of "Dvorak's Guide to

OS/2," and is the author of the soon-to-be-released "Cyberspace: The Human Dimension."

PC Magazine columnist John C. Dvorak has said "Dave Whittle's background and his years at IBM give him an unusual and unique perspective on things. I'm always interested in his insights . . ."

Whittle has been wrestling with disk space problems for over 16 years. You will come away from this meeting entertained and informed, with a better understanding of your hard drive and how to tune it for best performance.

Whittle will provide time for an open Q&A period and will bring valuable door prizes, informative handouts, and a special on-the-spot user group price for those wishing to purchase this outstanding product at the meeting. Don't miss this exciting opportunity!

Microsoft Publisher 97

Software review by Nancy Dennis

Now you can have it all in - one software package. With Microsoft Publisher 97 CD Deluxe you can create every size of greeting card that your printer will print, also professional flyers, calendars, brochures, business and personal stationery and

forms, origami, labels, banners, envelopes, and dozens of miscellaneous items such as bookmarks, gift tags, etc. Microsoft Publisher is a full-featured desktop publishing program that keeps getting better and better, and has long been a favorite program of mine.

Two of the major new features are Mail Merge and the Web Site Wizard. The addition of these two features make Publisher a complete business as well as personal desktop publishing program. There are 18 Wizards in all to help create customized, professional-quality publications. You can choose to start your publication with the help of a Wizard, or pick a blank page already formatted for full page, web page, book fold, tent fold, side fold card, index card, business card, poster, banner, or top fold card. If none of these options seem to suit your needs you can set up a custom blank page.

Your documents in Publisher are called publications and are saved with a .pub file extension. And you are given the option of saving your publication as a template so that it can be used again. In previous versions of Publisher templates came as part of the program and were available as add-on packages that you could purchase. Since I

started with Publisher back with version 2, I have accumulated quite a full folder of templates. You won't see the Template tab when you first install this new version of Publisher unless you have a previous version and have a template folder already. But once you save your first publication as a template, the opening screen will then include a Template tab for you to choose from, along with the Wizard tab, Blank Page tab, and Existing Publication tab.

Your publication can consist of one page or many pages. You can use the "background" feature to place any object, page design or numbers, etc. on a background view of the publication. The reason this is helpful is that this background is only accessible when you actually change to that view of the publication. So whatever is placed there will appear on each page of the document. For instance if you want to set up a book with page numbers and a graphic of some sort on each page, you only have to do it once on the background and it will appear on every page of the book. You might also use this feature for a watermark on a page. You also have the option to ignore the

background if you need to for pages where you don't want the background (like the cover page or a chapter page). I have used the background feature to draw cutout lines for greeting card envelopes and place them on the background, so they won't be disturbed while I place text and graphics on the page. Note: For those interested in my personal templates, bring a disk and I will be happy to share them with you. They won't work unless you have Publisher 97. Another place I used the background feature was for the Compute.her News. Most of the design elements of the pages were taken right from a Wizard in Publisher (my secret is out).

There is full text editing ability with all of the standard features such as text style, tables, tabs, indents, bullets, spell checking, etc. OOPS made a mistake, there is an undo button on the button bar that can be used for most all functions. For MS Word users there is a feature called the Word Story Editor that users can right mouse click and switch to MS Word to edit the article. You can import from most all popular text formats into Publisher. I did have to call tech support to find out how to get a filter for Ami Pro

however. This brings up one very important feature of Publisher - the tech support. With this program you receive free life time support (you pay the toll call). I have called this number a few times over the years I have been using Publisher and found prompt, very helpful tech people on the other end of the line. Microsoft deserves a hand for this feature. In the case of the Ami Pro filter, Microsoft sent me a disk with full installation instructions within a few days of my call.

With Publisher you are also able to draw using the basic design tools for drawing lines, ovals, boxes, and custom shapes. Each design element can be colored, shaded, filled, grouped, cropped, and rotated, etc. If you need more drawing capability Publisher comes with Microsoft Drawing 1.01 applet. With this applet you are able to change a graphic to suit your needs. Publisher also includes the WordArt applet which allows you to create special text effects, and a Microsoft Note-It applet to insert notes in your publication.

With this new version of Publisher also comes the Microsoft Clip Gallery Live. This new Gallery includes

5,000 pieces of high-quality content. The Gallery also stores pictures, sounds, and video. The Gallery can be customized to include all the art, sounds and video on your hard drive. There is also a Web button located on the Gallery window to connect directly to the Microsoft's Web site for Publisher 97 owners and download, free of charge, more clip art, pictures, video, and audio clips.

Microsoft Drawing, Note-It, WordArt and Clip Gallery are all OLE2, which means that they can be inserted into any program that supports the OLE2 insert object feature. For instance, I am writing this review in Lotus Word Pro and I am able to create an object in my document using any of the Microsoft applets above.

Another favorite Publisher feature of mine is the "Fancy First Letter Gallery". With your cursor anywhere in a paragraph of text you can select the menu item Fancy First Letter and select the default, or create a custom drop cap for your paragraph. It can't get easier than this.

Still another feature of Publisher is the Design Checker, which reviews your publication for design and technical errors. An example of this feature is to check to see that all of the text frames have text flowing properly

from page to page. I found that when I used the new Web Page feature, the Design Checker was very useful. I didn't realize that, for purposes of publishing to the web, you should not have frames overlapping. When I ran the Design Checker on my first Web Page it gave me quite a lesson in proper web design. For a novice like myself, this feature helped me design a pretty good-looking web page. The program comes with over 100 backgrounds, photos, and Design Gallery elements optimized for the Web.

Here is a brief review of how you can use Publisher to create a web page by using a publication you already are working on. Let's say for example you have worked on a poster with some graphics and text that you feel you would like to publish to the web. The first step is to go the File menu and select "Create a Web Site from current Publication". When you do this several things happen. First you are asked if you would like the Design Checker to check your publication; then you are asked if you would like Design Checker to test the publication for its ability to load the graphic on the web. Both of these questions you can answer yes or no. I would suggest if you are new to web page creation that you take all

the "checking" that is offered. After the page has undergone this process the publication now on screen is an unsaved publication. Your original poster is still saved at whatever you named it, and you are now working with a new publication. New buttons are added to the button bar, and there are different menu items as well, now that you are in the world of web page design in Publisher. The next step is to publish your page(s) to the web. When you select the File menu item there are four menu items added now that you are in the "web mode" of Publisher. They are:

- Preview Web Site (opens your browser with your web page)
- Web Site Properties (opens a dialog box for naming or renaming your web page)
- Publish to Web (opens the Web Publishing Wizard)
- Publish Web Site to Folder (opens a dialog box to save the page to a folder).

With a few tries and some help from the Side-By-Side Help menu, I was able to publish my first page into a folder on my hard drive to later upload directly to AOL.

The new Mail Merge feature allows you to either create a new address list or import lists from Word or

Works and Microsoft Access, FoxPro, and other databases for easy mailing of Publisher documents. There are several new Avery label templates that can also be used with the Mail Merge function. To test this new feature I created a 3-fold pamphlet for our user group's annual renewal. Then I created a text frame for the names and addresses and selected the menu item Mail Merge. The first option on this menu is Open Data Source. This brought me to the selection of file type, which for this review was MSWorks, and then the selection of the database file. Note: I did have to do some work on the database fields in order to get the merge to work. Some were not defined properly. The merge went well and even had the text rotated on the pamphlet center panel. I was very impressed.

The new Postcard Page Wizard was my next test for both the creation of the postcard and the merge. I was able to create a postcard with four on a page, and merge different names on each one. The Page Wizard includes a default font preferred by the US Postal Service for its scanning equipment.

Speaking of scanning - you are able to scan a picture

directly into Publisher if both the scanner and the scanning software support TWAIN compatibility. This saves time by not having to scan into your picture program and import into Publisher. If you do need to import, Publisher supports all of the popular file formats for graphics. Also this new version of Publisher has a Font Preview Menu item to view what a font looks like in one easy step. This feature as well as others can be turned off or on with the Tools, Options menu item to help users customize Publisher to meet their needs. You may, if you wish, skip the Startup dialog box, etc.

There are 160 types of borders to place around a frame or picture, and the ability to create your own custom borders from clipart or picture files. Your creation will be added to the Border Art collection for your use at a later time.

Along this same idea, Publisher has a feature called Design Gallery. The Gallery has many pre-designed items in categories such as; Attention Getters, Headlines, Pull Quotes, etc. You can pick from these designs or save one of your own designs in this gallery to be used again. You can even create your own categories for

designs, like "Nancy's Designs".

Last, but not least, for this review I would like to try to explain the book that comes with Publisher. This is not exactly a manual, although it does explain how to do some features. It is titled "Microsoft Publisher 97 Companion". This 328 page book is full of desktop publishing suggestions and advice. Some of the chapters are; Designing Like a Designer, Laying Out Your Publication, Booklets from Start to Finish, just to name a few. The Companion also includes a Pictures Gallery with thumbnails of the clipart and fonts, Publication Gallery showing all the types of publications included with the program, and Border Gallery showing the border art as well as ideas on how to use them. There is also a section under Printing on using an outside printing service. This is a feature within the program that I did not test, but feel sure that if I ever need to take my work to an outside printing service, I will find all the information and even a special menu item for that purpose. Be sure to read this book cover to cover when you get the program. It is excellent!

System Requirements:

386DX or higher processor, Win95 or Windows NT, 6MB of memory, 8MB recommended, Hard disk with 6 to 32MB of available space, CD-ROM drive or a 3.5 disk drive (for the disk version), VGA or higher-resolution video adapter (Super VGA 256-color recommended). Note: I installed the whole program, art and all, on my hard drive, and it took around 140MB of space.

The following components are optional: 9,600 bps or faster modem required for online features (28,800bps recommended), Microsoft Internet Explorer 3.0 or compatible WWW browser required for Microsoft Clip Gallery Live and Web Site Preview, WWW access required for Microsoft Clip Gallery Live.

Pricing: \$79.95, available on CD-ROM or on set of 3.5-inch diskettes. If you are a registered user of previous versions of Publisher there is a coupon in the box for a rebate of \$30, good till 10/97. I have seen the program at OfficeMax for \$69, and occasionally on special at other area stores. There is a 30-Day Money-Back Guarantee stamped on the box.

I would recommend this program to anyone who likes desktop publishing. Microsoft Publisher 97 is on

the top of my list of favorites!

PrintMaster Gold CD Publishing Suite

Software review by Donna Moehlich

PrintMaster Gold CD Publishing Suite by Mindscape, Inc. All rights reserved by Micrologic Software, Inc. is a fantastic program for creating multiple artistic projects using a gallery of more the 5000 graphics, fonts, and other designs. In addition to creating cards, calendars, letterheads, fax sheets, and business cards it even makes envelopes! The program creates various sized envelopes too. I could not believe it!

What really caught my attention however, was the audio instructions that accompany this program. I have never encountered a program, other than a tutorial, that actually orally describe actions to take to produce your project. The audio portion can also be repeated with a click on the audio button that facilitates learning through repetition. I was impressed, but do want to add that the audio gives tips on how to create a project as opposed to providing all of the answers for a given problem. Valuable

insights to specific aspects of the mechanics of the program are extremely helpful.

I spent hours playing with the various projects. I created a card, calendar, business card, and certificate and that is just a small sampling of all the possible projects. Just looking at the categories of the cards there are 12 types of cards that can be created using preselected clip art or you can make your own using the giant gallery of clip art. The possibilities for making cards include anniversary, birthday, holiday, best wishes, get well, and sympathy just to mention some. What a pleasure, to create a Halloween card where I had a selection of about 10 graphics appropriate for that day alone. The repertoire of clip art is a real asset for me, in as much as I have no interest in free-hand drawing. I found I could make a card by folding a piece of paper in half and then half again which quarters an 8 1/2 by 11 inch sheet of paper. When you select a graphic, and then insert it into the card it is possible to resize and change the color through use of a color chart that they provide thus adding your own touch. A background can be inserted to which you can overlay your graphics and text. Another feature of this program is the inclusion of an

Address Book. Through a mail merge system mailing lists can be used to send out Christmas cards, invitations, and other types of mass mailings.

I must admit that when it came time to create the envelope I had some difficulty. It was a pleasure to be able to select from a variety of envelope sizes and add graphics to boot! However, when I went to print the envelope I could not figure out whether or not there were supposed to be lines to help you fold the envelope correctly. When I called Tech Support I was disappointed to find out that the program will put graphics on an envelope fed into the printer but does not actually create an envelope with fold lines. I also noted there is an automatic feed for envelopes that leaves me in a quandary regarding the technicalities of creating an envelope. I will get this one figured out before long.

Banners, posters, labels, and certificates you name it and this program can do it. Besides having the predesigned graphics there are also 23 subjects

containing a multitude of clip art. The subjects include animals, cartoons, sports, popular objects, religion, and shapes. Each subject topic has a large selection of clip art from which to choose. You view the clip art and see a the thumbnail size picture. In order to see a larger version you can click on a box that allows you to see an enlargement of the picture. In addition to using the clip art within the program you can also copy and paste to any other project.

Adding text is a joy. The ability to have such a large selection of fonts and print size gives each project a personal flare. Once you have added text you can arrange, resize and justify the text to the left, center or right merely with a click of the mouse.

The other problem I encountered was when I attempted to add a border to a business card. I was unable to put the border around all four sides of the card. I could insert the border but could not swing the border to fit all four sides of the card and then resize or narrow the border. In reviewing the manual I could not

immediately find an answer. I asked Tech Support about this as well and was advised that the graphics for business cards and letterheads are all batched together. This in effect reduces the number of selections for business if you are wanting a four sided border. Some of the graphics were geared specifically to each of the end products.

To say that I like this program is putting it mildly. I have nothing but raves for the program except for the inability to create a single fold card and an envelope with fold lines. I would recommend PrintMaster Gold CD Publishing Suite to everyone who enjoys clip art creative programs.

System requirements are Windows 3.1 or Windows '95. A 386 or greater IBM compatible computer and 4MB of Ram and 12MB of hard drive space are required. A CD-ROM and Audio card are also needed. You will find the software in most retail stores for around \$40.00.

A Good Investment!

For the cost of a typical magazine subscription:

- Two meetings per month
- Question answer period
- Speakers
- Software demonstrations
- Problem Solving assistance
- Hardware demonstrations
- Beginners instructions
- BBS access
- Monthly newsletter
- Fellowship
- Raffles

The library now charges us \$100 per month for us to meet there twice a month. Postage runs over \$30 per month. BBS phone lines cost us \$35 to \$50 per month. Copying costs for the newsletter run about \$20 per month. Refreshments expenses were \$100 over donations last year. Miscellaneous supplies run about \$20 per month.

Your contributed support of the club by renewing your membership will help keep the club vibrant and give you a far better bargain or return on your investment than any magazine subscription. A good investment!

INTERNET BASICS: SO YOU HAVE A MODEM . . .NOW WHAT?

by Lou Bassetti

A lot of us have computers with modems already installed but have yet to make the leap into the vast world of the Internet. In speaking with fellow club members, it seems that people are reluctant to make the plunge for three main reasons: 1) the cost of a monthly subscription to one of the many Internet services, 2) doubts about its usefulness, and 3) a perception of its complexity. I hope to provide answers to some basic questions that arise in each of these areas of concern. I am merely a novice myself, but I do use the Internet daily and try to stay current through my reading, and I hope that some of what I might offer will be helpful in making up your mind about whether or not to jump on the information highway, take the plunge into cyberspace, or whatever the pundits are calling it these days.

First off, costs are generally the same across the

board no matter what kind of service provider you use, so if you are not comfortable with spending anywhere between \$10 and \$20 per month, then you probably need read no further. You may find that using a free email service such as Juno is all you are interested in anyway. That's fine, and you can at least feel that you are making use of your modem device. However, for those of you who are curious about what all the hullabaloo is about, read on.

COMMERCIAL ONLINE SERVICES

As with most aspects of the computer world, jargon and acronyms seem to abound in talking of the Internet. Since one must be able to intelligently discuss these aspects, it becomes necessary to learn at least some of the acronyms and specialized vocabulary, I will try to explain each instance as it arises. To gain access to the Internet, it will be necessary to subscribe to either a Commercial Online Service or an Internet Service Provider (usually referred to as an ISP). Examples of Commercial Online Services are America Online, CompuServe, or Prodigy. You will find that rates for them are virtually identical:

\$9.95 for first five hours and \$2.95 for each additional hour. (America Online has recently added the option of \$19.95 per month for unlimited Internet access, and I suspect the others will soon follow. If you turn out to be a heavy Internet user—logging in 10 or more hours per month—this may be the option for you). The distinction between the various Commercial Services has to do with the various specialty services offered to their members, such as professional and special interest forums, weather, news, games, online encyclopedias, airline reservation access, and online shopping. Also, you will find that each online service differs in the way in which information is displayed on your monitor. This display is usually referred to as a Graphical User Interface (or GUI). America Online is usually considered as having the easiest to use graphical interface, allowing simple and convenient access to the many features of the Internet along with online help, usually at no charge. You should compare costs but keep in mind that an easy-to-use interface could save a lot of frustration and wasted online time for the novice

user.

Internet Service Providers, which are usually locally based companies, offer access to the Internet with very much the same rate schedule as their Commercial counterparts. Although it used to be true that you paid a premium for Internet access through a Commercial Online Service such as America Online, Compuserve, etc., the two types of available services are becoming indistinguishable relative to cost. All of them will probably offer direct Internet access to the World Wide Web (a network-wide, menu-based program linking information sources on the Internet), as well as file transfers, Newsgroup access (Newsgroups bring together people around the world for discussion of shared interests), and E-mail features. And remember that with any service, whether national or local, you will likely be using a local access phone number, so there should be no telephone charges for your online activity.

Determining whether the features offered by the Internet will be useful, interesting, or even fun for you largely depends on your spending some time surfing the net” to find out for yourself. This is something that can be done for free at

most public libraries, and, of course, lots of press has been given to describing what’s out there. Some of it has been mere hype but, on the other hand, something must account for the fact that some 30 million people worldwide use it today as a source of entertainment, information, and communication. Other than sending and receiving email, the most popular Internet activity today is browsing the World Wide Web and its international collection of millions of cross-linked graphical “pages.” These “Home Pages” or “Web Sites” offer a multimedia collection of sound, video, photographs, animation, as well as text on virtually any topic. The Web can only be accessed by using a Web Browser in conjunction with one of the services mentioned above. All of the popular online services have their own Web Browsers and some are even available free online. Currently, two of the most popular are Netscape Navigator and Internet Explorer. Each Web Site is identified and searched by means of what is called a URL* (Universal Resource Locator) or http address (Hypertext Transfer Protocol). This may sound complicated, however, most Online Services will drop you directly into a Search Engine

that allows you to search for the topic of your choice using plain text. Recently, I was looking for a graphic image of an umbrella, which I needed to use in creating an invitation for a local event. I decided to try finding it on the Web on my home computer, merely by searching on the word “umbrella” using the Lycos Search Engine website and wound up locating it and printing it out, with the whole effort taking about two minutes.

*Example of a URL: “http://thelist.iworld.com” This specific address, by the way, will bring up a Web Site called “The List”, which is a comprehensive, searchable database of Internet Service Providers that you can search or browse by provider name, location, and, most importantly, by area code.

PC Handyman for Windows 95

from the makers of Norton software
by Phil Greb

Symantec Corp. has come out with another fine piece of software which will drastically reduce the frustration level for new Windows 95 users. The program is called **PC Handyman** and it's a product that can automatically solve more than 20,000 hardware or software problems. At the same time, it will reduce or prevent PC crashes and screen freezes with CrashGuard and Anti-Freeze. The latter two features had been offered on the Symantec web-site, but are now included in this package at no extra charge.

A short time ago, I reviewed a program called Healthy PC by Symantec, and it appears this is an extension of the H-PC program which generally searched for viruses on your computer. This program, however, offers many more features and has the ability to perform most of its problem solving using information stored in its database. It uses artificial intelligence (AI) to anticipate and analyze different types of problems. In addition to being able to fix the above stated multitude of problems, Handyman automatically performs 16 regularly scheduled software and hardware checks.

The User's Guide is a brief (67 pages), well written manual, and the set-up instructions take up

less than half a page. This was my first indication that Symantec had created something different in the line of software. It really is a program for a beginner — or someone wanting to know more about his/her computer. The guide includes explanations for some of the more basic terms used in working with computers, and it does a fine job of defining computer terminology.

The main job of this software is to take care of your computer without interrupting your work. Most of the time it works in the background, but if you have a question about something in Windows 95 or about your computer, you can ask a question, and through a series of dialog boxes, the handyman will come up with an answer. Some of the questions it can handle are those relating to printer connections, changing desktop icons, and problems relating to hard drives. The list is endless..!

The opening screen (like Healthy PC) is a desktop showing all the components of a computer system. In addition, there is a one line dialog entry box where the user can pose a question and ask for answers or methods to be used to solve the problem. If you move your cursor over a desk top object, and it changes colors, you can activate that function. You can click on the symbol to learn more about it. In most situations, a computer "Nerd" will re-phrase the question in a dialog "balloon" and in the same manner, will inform you of what can be done to keep your computer in tip-top shape. As stated in one of Symantec's ads, this is the "man on the scene, working

unobtrusively in the background and reporting back to you with warnings, solutions and handy tips."

When you install this software, an icon is placed in the taskbar tray and the program will begin to monitor your system. Many of the duties of Handyman relate to maintaining the hard drive(s) and files, memory and hardware operations, it scans for viruses, and searches your system to determine whether certain functions need to be updated from Symantec (usually on a monthly basis.) Using LiveUpdate, it will dial the Symantec BBS or WebSite and upgrade the program.

According to Symantec, Norton CrashGuard and Anti-Freeze features added to this program give a little hand-holding to those that tend to worry about lost work and corrupted data. These applications are reliable and simple recovery programs that will intercept and repair most crashes and "frozen" applications long enough for the user to save their work. And, the user interface is designed so that users of any experience level can use them. They will run in the background and intercept most 16-bit & 32-bit crashes before your work is lost.

PC Handyman is available at most computer stores at or near the suggested retail price of \$49. So if you are a novice or an intermediate Windows 95 user who wants just a little more hand holding, look into this program. It will run on a 486DX or higher IBM-PC or compatible system with at least 15MB of free hard disk space. The video feature is really worthy of the price tag, and I can recommend this program for

out members.
